> Toronto, ON, Canada 2015–2019

## WORKING PAPERS

## "Industry Shakeouts after an Innovation Breakthrough" (Job Market Paper)

Conventional wisdom suggests that after a technological breakthrough, the number of active firms first surges, and then sharply declines, in what is known as a "shakeout". This paper challenges that notion with new empirical evidence from across the U.S. economy, revealing that shakeouts are the exception, not the rule. I develop a statistical method to detect breakthroughs by isolating sustained anomalies in net firm entry rates, offering a robust alternative to narrative-driven approaches that can be applied to all industries. The results of this method, which reliably align with well-documented breakthroughs and remain consistent across various validation tests, uncover a novel trend: the number of entry-driven breakthroughs has been declining over time. The variability and frequent absence of shakeouts across breakthrough industries are consistent with breakthroughs primarily occurring in industries with low returns to scale and with modest learning curves, shifting the narrative on the nature of innovation over the past forty years in the U.S.

"Much ado about Property Rights: China's Agricultural Wedges" (with Wei Lin & Shijian Yang)

Recent work in misallocation centers on estimating the effects of removing policy distortions on aggregate productivity and output. However, the efficacy of reversing distortions on allocation strongly depends on whether the agents affected have market incentives and on the relationships between the individual distortions. We show that a 2003 Chinese land law, which abolished a decades-old policy of egalitarian land reallocation and allowed land rentals, improved allocation among farmers that sell to the market, but not in general. Using a rich panel dataset of the production and sales behavior of Chinese farmers, we decompose the wedges by factor input. We quantify the impact of the 2003 land law on individual factor distortions and calculate the impact of the law on output. We show that impact of the law is relatively small compared to potential welfare gains from the complete elimination of individual wedges.
